Fiume Santo

Il Fiume Santo scorre da sud verso nord nella porzione nord-occidentale del territorio comunale di Sassari e, in misura marginale, nel Comune di Porto Torres, per quanto riguarda la sponda destra.

Il bacino del Fiume Santo è posto alla sinistra del sistema idrografico di Genano e l'asta fluviale costituisce il limite ovest del territorio comunale di Porto Torres sull'isola madre.

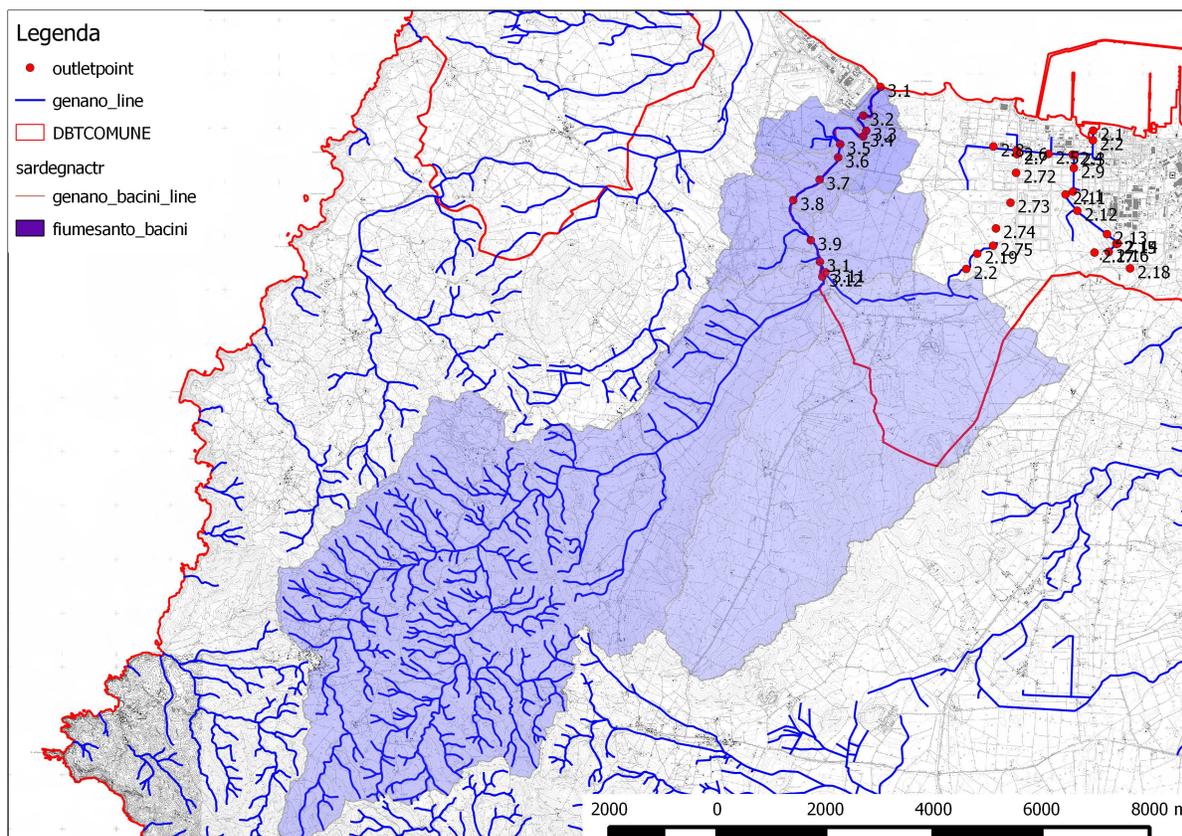

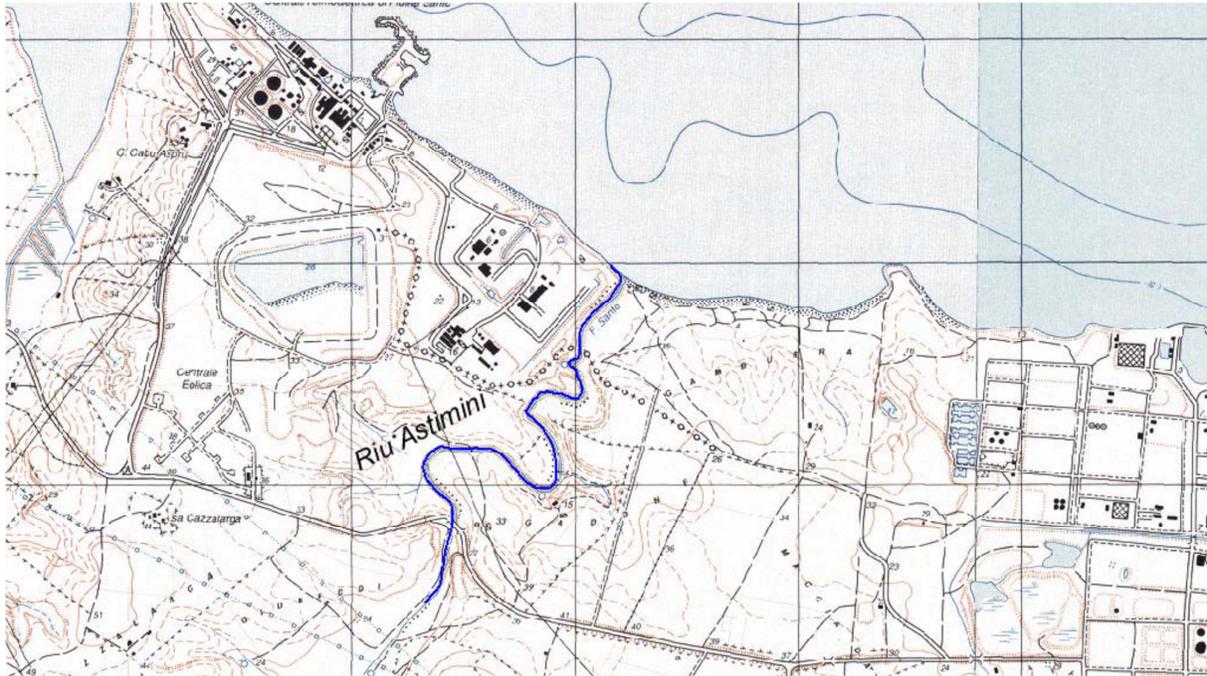

Fig. 1 - Bacino del Fiume Santo

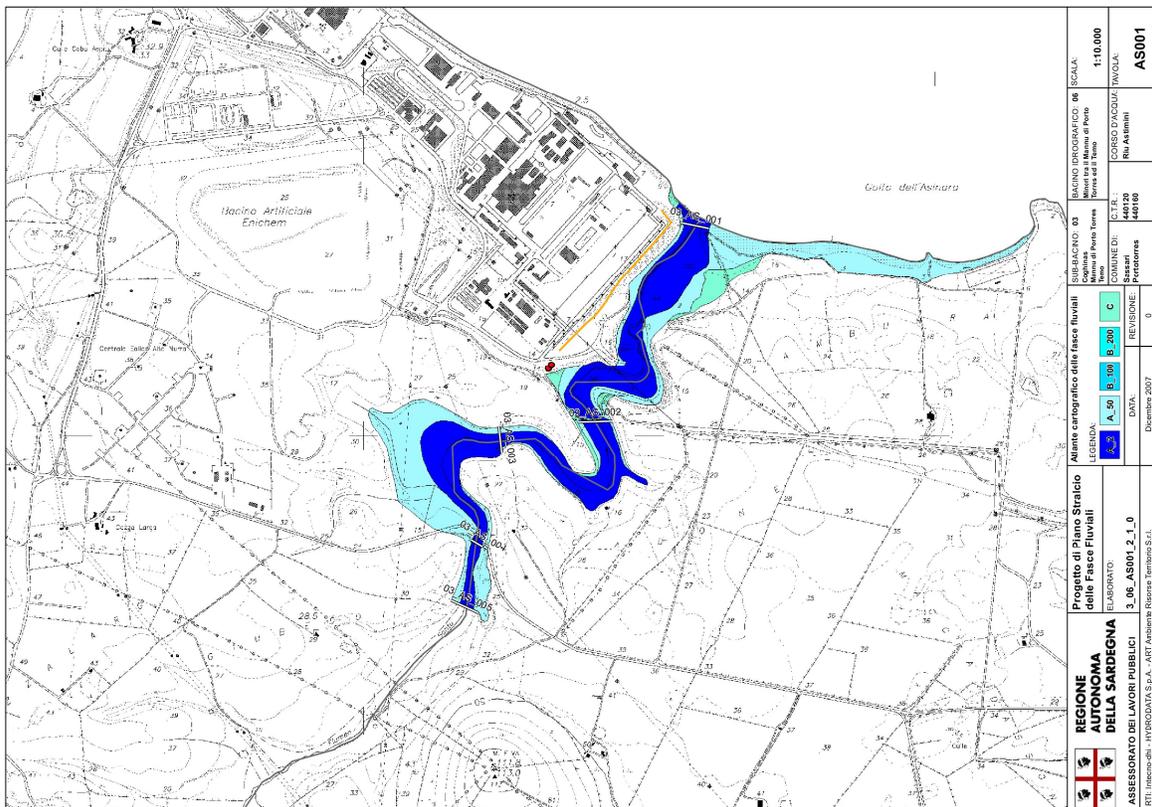

Gli interventi antropici caratterizzano la parte finale del bacino del Fiume Santo, per la presenza, alla foce del fiume in sponda sinistra, di un importante complesso industriale, Polo Elettrico (centrale E.ON.- ex Endesa e impianti Terna).

Il primo tratto del Fiume Santo è stato oggetto di studio nel PSFF (in tale studio viene citato con il toponimo Riu Astimini). Il tratto studiato ha una lunghezza di 2,6 Km partendo a monte della strada provinciale per Stintino. Lo studio è stato condotto seguendo gli indirizzi indicati per la redazione dello studio. La ricognizione sul campo eseguita per il presente studio ha sostanzialmente confermato le indicazioni ed i dati riportati nel PSFF. Pertanto, in analogia con quanto fatto per il Rio Mannu di Porto Torres, si sono assunte nel presente studio le conclusioni riportate dal PSFF per il tratto studiato provvedendo a completare lo studio nei tratti del Fiume Santo che interessano il territorio di Porto Torres, indicati e descritti successivamente nella presente relazione.

Tratto del fiume Santo studiato nel PSFF

Il Fiume Santo non è stato oggetto di indagine nella fase di definizione del PAI mentre è stato oggetto di specifica analisi di compatibilità idraulica nell'ambito del Piano Urbanistico Comunale di Sassari, così come previsto dagli artt. 8 e 26 del PAI. Dalle risultanze dello studio condotto nel PUC di Sassari viene confermato che il corso d'acqua è interessato da un'area a pericolosità idraulica molto elevata (Hi4).

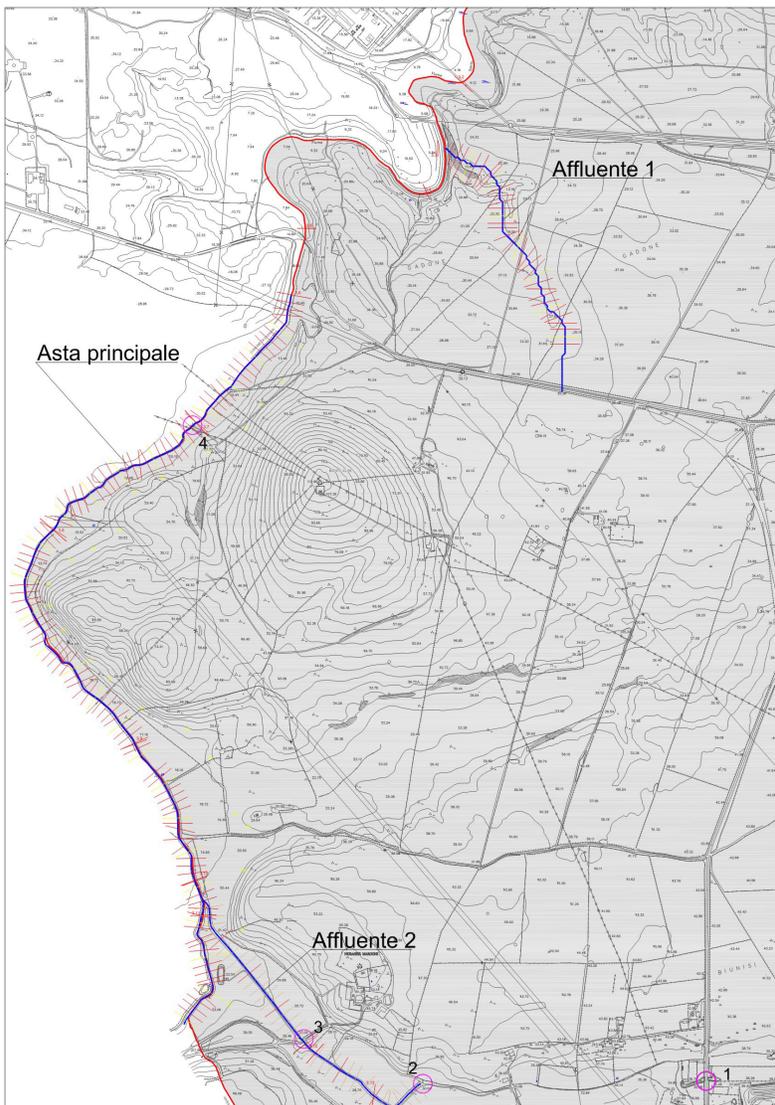

Le aree di pericolosità idraulica individuate nel PSFF. Il Fiume Santo non è stato indagato dal PAI vigente.

Da un'attenta analisi della toponomastica riportata nella Cartografia Tecnica Regionale si individua l'asta principale del bacino con le seguenti denominazioni:

- Flumen Santu (alla foce);
- Riu Sant'Osanna (in località Trobas);
- Riu d'Astimini (in corrispondenza dell'intersezione con la prov. n. 46 in località Anzu, denominazione mantenuta fino alle sorgenti).

Trattandosi di bacino sopra i 60 kmq la stima delle portate da porre a base della individuazione delle aree di pericolosità idraulica, in coerenza con quanto suggerito nel metodo VAPI, è stata svolta facendo riferimento alle piogge giornaliere.

I tratti analizzati nel presente studio sono riportati in azzurro nella immagine seguente. Si tratta dell'asta fluviale principale nel tratto che definisce il confine comunale tra Sassari e Porto Torres nonché di due affluenti in sponda destra idraulica che scorrono nel territorio di Porto Torres e che sono stati analizzati in ragione di possibili problemi connessi fondamentalmente con le intersezioni con la viabilità rurale esistente.

Tratti studiati del bacino di Fiume Santo

Oltre all'asta principale nel tratto che delimita il territorio comunale, lungo la quale l'analisi sulla cartografia disponibile ha evidenziato la presenza di una intersezione tra l'asta fluviale e la viabilità esistente, si sono individuati due intersezioni con un affluente in sponda destra, nel territorio di Porto Torres (individuate con i numeri 2 e 3 nella carta posta a lato).

Inoltre si è individuato una ulteriore intersezione (la n. 1 nella carta) che appariva necessario verificare.

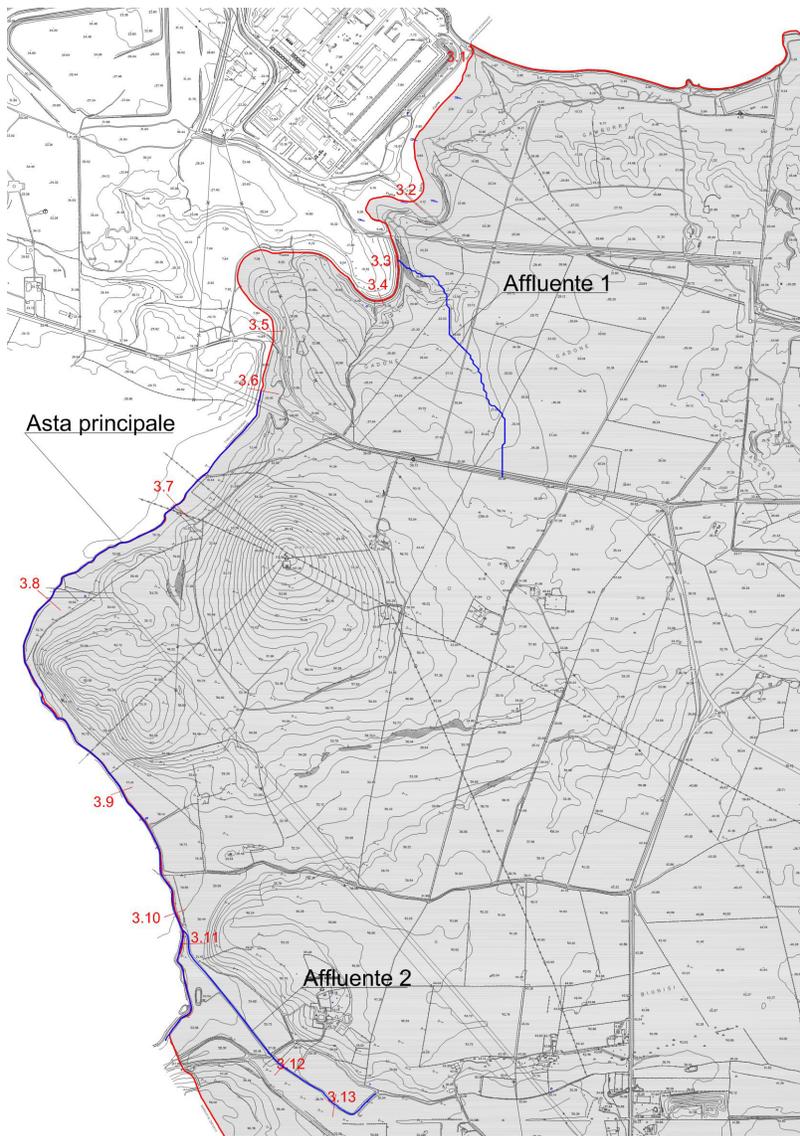

L'indagine sul posto ha evidenziato come l'intersezione 1 riguarda una depressione naturale, non collegata direttamente all'asta fluviale, che raccoglie acqua piovana nel periodo invernale la quale viene utilizzata in ambito locale a scopi agricoli.

L'intersezione n. 2 dell'affluente 2 interessa una strada di penetrazione agraria e si tratta di una intersezione a raso senza tombini o ponticelli di sorta.

L'intersezione n. 3 dell'affluente 2 interessa una strada di penetrazione agraria. La strada supera il corso d'acqua con un ponticello la cui sezione non è adeguata al deflusso delle portate poste a base della presente relazione.

Infine l'intersezione n. 4, che interessa l'asta principale, è anch'essa una sorta di passerella sommersibile oramai completamente interrata e con evidenti segni di completo abbandono. Molto probabilmente la strada non viene più utilizzata, come è evidente dalla vegetazione che ha invaso l'intero tratto stradale che adduce al ponticello.

Queste ultime due intersezioni sono documentate fotograficamente nelle pagine seguenti.

Per l'indagine idraulica sono state individuate una serie di sezioni di calcolo, riportate nella immagine a fianco.

Per ogni sezione si sono determinati i principali caratteri morfometrici e si è determinata la portata corrispondente ai periodi di ritorno previsti dalla normativa vigente, di seguito riassunti. Le prime sezioni di calcolo sono state elaborate per confrontare i risultati determinati con quelli riportati nel PSFF e posti a base di quello studio.

I dati sono risultati assolutamente confrontabili.

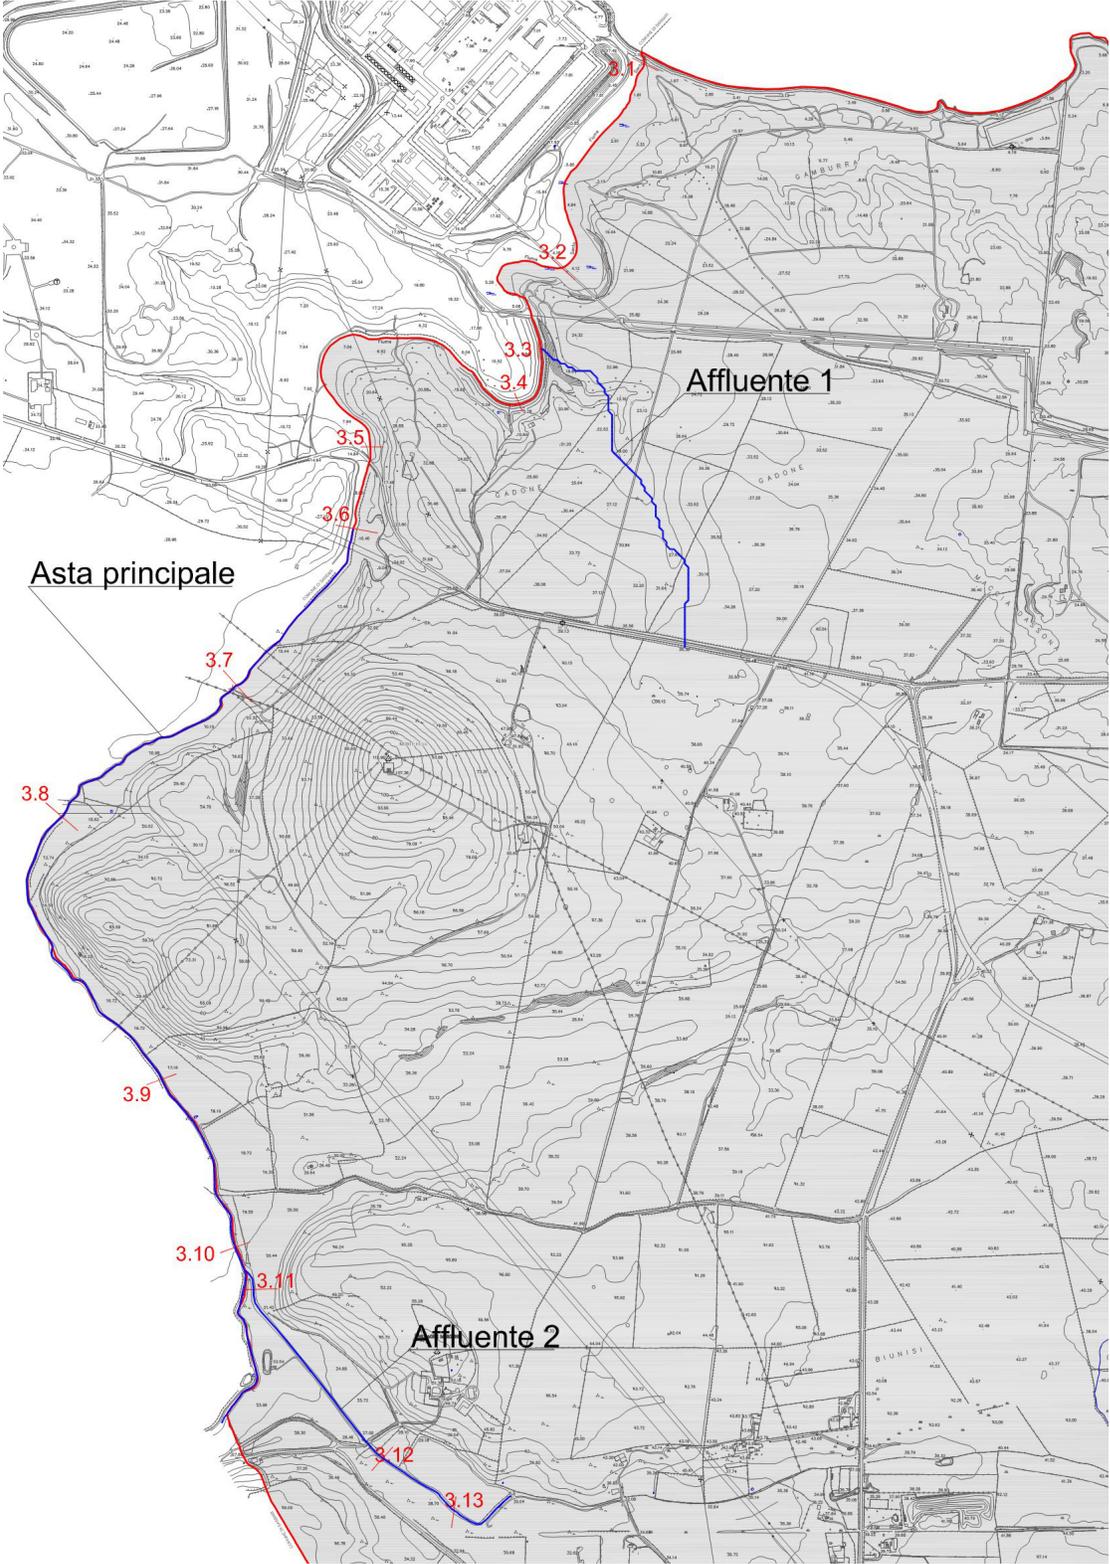

Sezione di calcolo	Area del bacino (kmq)	Q50	Q100	Q200	Q500
3.01	83.17	168.28	204.15	240.03	286.96
3.02	82.81	168.09	203.92	239.75	286.63
3.03	1.06	0.17	0.47	0.88	1.61

3.05	80.14	167.02	202.62	238.22	284.80
3.06	79.93	166.86	202.42	237.99	284.53
3.07	79.55	166.61	202.12	237.63	284.10
3.08	78.60	166.15	201.56	236.98	283.32
3.09	75.97	164.66	199.76	234.85	280.78
3.10	72.93	163.54	198.40	233.26	278.88
3.11	72.80	163.48	198.33	233.18	278.78
3.12	25.87	29.17	44.51	62.07	87.34
3.13	25.54	28.67	43.76	61.03	85.87

Le sezioni 3.03 e 3.11 definiscono rispettivamente i bacini degli affluenti Af1 e Af2.

Si riportano nel seguito i risultati delle analisi idrologiche e dei calcoli delle portate massime per i vari tempi di ritorno in corrispondenza delle sezioni di chiusura dei bacini.

Seguiranno i risultati delle analisi svolte con il software hec-ras riguardo le aste oggetto di studio del regime idraulico.

Sezioni di chiusura dei bacini oggetto di analisi idrologica e calcolo portate.
